

Q Write a c++ code which includes a class student.

Find out the space occupied by member function/member variable.

Here we can use the sizeof() operator to find the space occupied by member variable.

Member function do not occupy space in each objects, they are stored separately in the program memory.

```
#include <iostream>
using namespace std;
```

```
class Student {
```

```
    int rollNo;
```

```
    float marks;
```

```
    char grade;
```

```
public:
```

```
    void display() {
```

```
        cout << "Student Details:" << endl;
```

```
    }
```

```
};
```

```
int main() {
```

```
    Student s;
```

```

cout << "Size of int variable (rollno):" <<
sizeof(int) << "bytes" << endl;

cout << "Size of float variables (marks):" <<
sizeof(float) << "bytes" << endl;

cout << "Size of char variables (grade):" <<
sizeof(char) << "bytes" << endl;

```

```

cout << "Size of Total size of student object:" <<
sizeof(s) << "bytes" << endl;

```

```

return 0;

```

O/p:

Size of int variable (rollno): 4 bytes

Size of float variable (marks): 4 bytes

Size of char variable (grade): 1 byte

Total size of student objects : 12 bytes
